PORTFOLIO PROJECT · REAL ANONYMIZED DATA: UCI BANK MARKETING, 2008–2010

Which customers say yes, and how many calls is enough?

41,188 customers from a retail bank's term-deposit phone campaigns.

POWER BI · PORTFOLIO

Call cap (what-if): 3

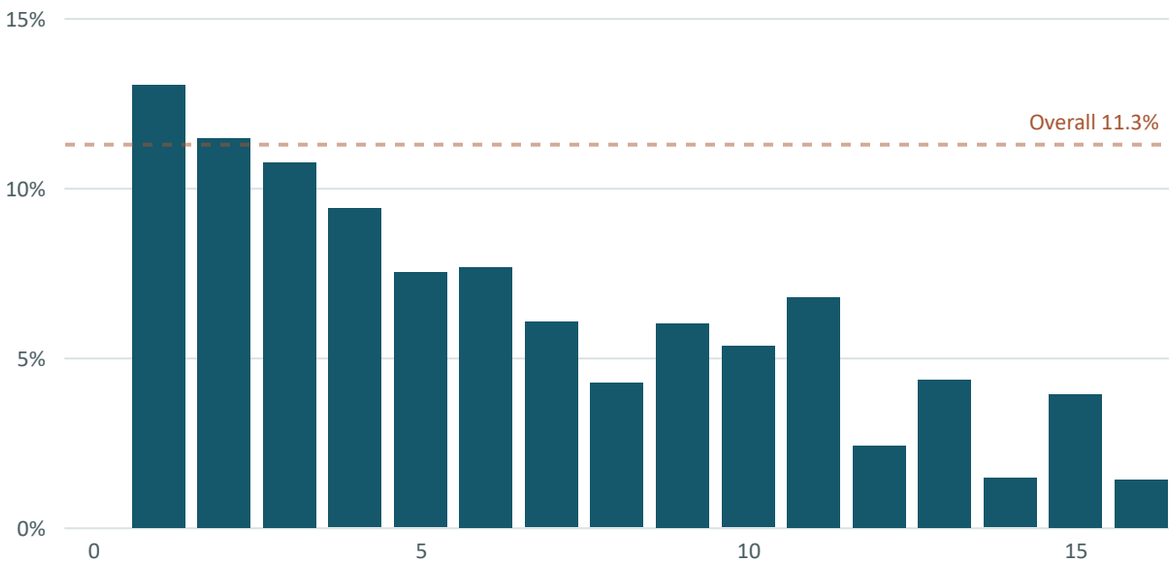

Phone: All

Definitions: conversion = customers who opened a term deposit ÷ customers called. Call cap (what-if): the most attempts any customer gets; the cards show the calls saved and the sales lost at that cap.

Conversion rate	Call cap	Calls saved	Sales lost	Past customers	Mobile advantage
All 41,188 customers	Attempts per customer	28,044 fewer calls	555 customers	5.8× the overall rate	Conversion ratio
11.3%	**3**	**26.5%**	**12.0%**	**65%**	**2.8x**

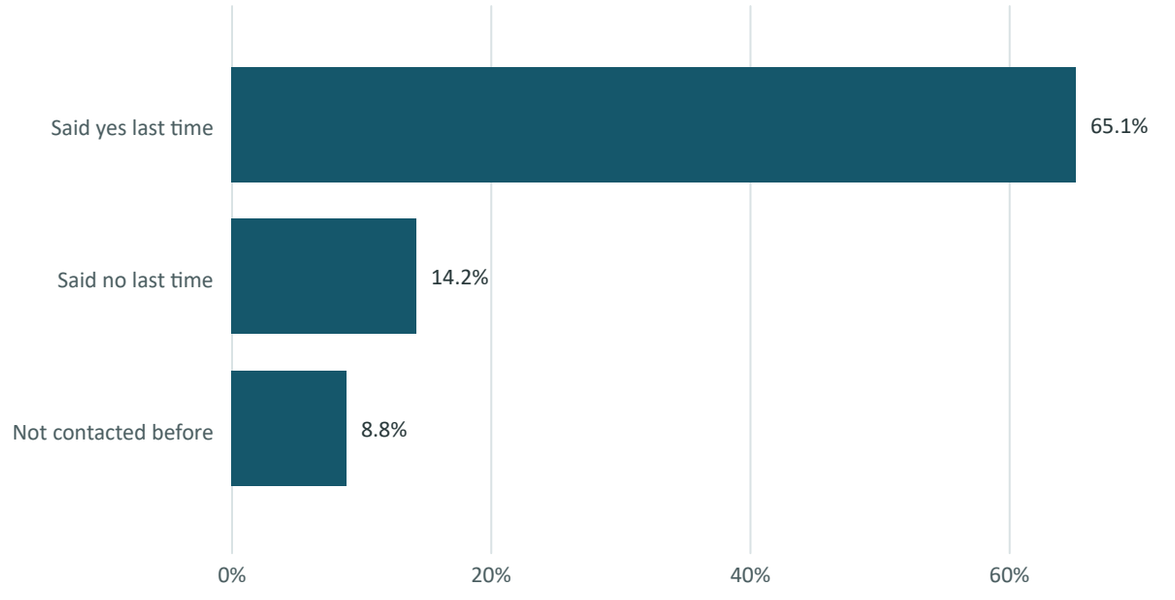

Conversion by number of calls

Each extra attempt converts less. Dashed line = overall rate. 16 = 16 or more.

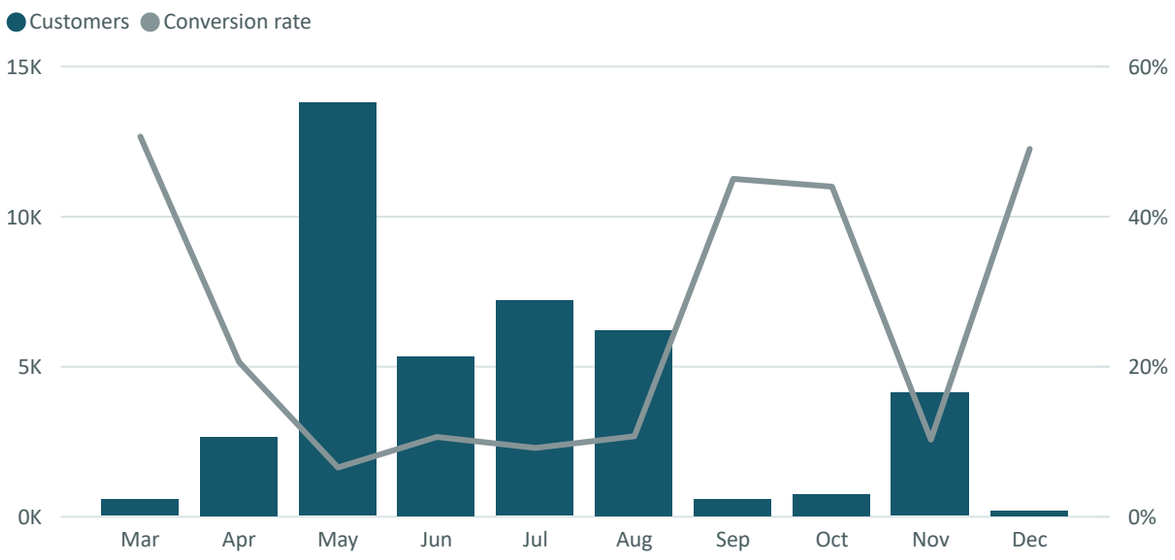

Conversion by previous campaign outcome

Past customers say yes far more often.

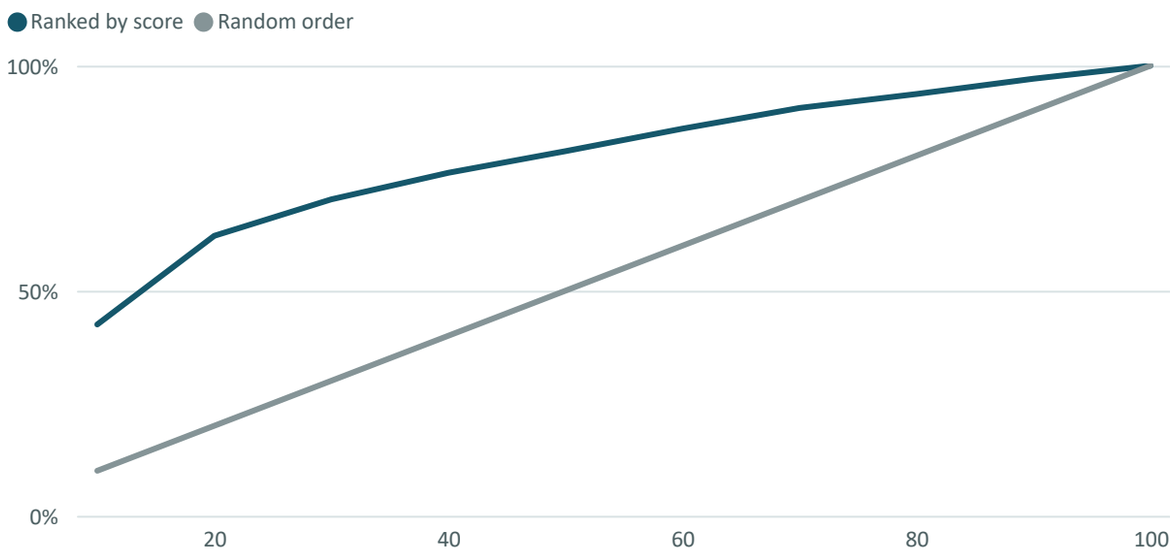

Conversion and volume by month

Busy months convert worst; quiet months used warmer lists.

Who to call first: gains from the pre-call score

Logistic regression without call duration (known only after the call). AUC 0.79 on hold-out.

What this means

1. Cap attempts at three. About a quarter of calls saved for roughly one sale in eight; use the slicer to test other caps.
2. Work the list in score order. The top 20% of customers by score hold 62% of the sales.
3. Set targets against the rate cycle. Conversion was 46% when Euribor was under 1% and under 5% above 4%: conditions the team cannot control.
